

MAXWELL FISHELSON

<http://maxfish.com>

maxfish at mit.edu

EDUCATION

Ph.D. in Theoretical Computer Science
2020-2026

Massachusetts Institute of Technology (MIT)
Supervisor: Prof. Constantinos Daskalakis

B.S. in Mathematics
2016-2020

Massachusetts Institute of Technology (MIT)
GPA: 4.9/5

RESEARCH

Breaking the $T^{2/3}$ Barrier for Sequential Calibration

STOC 2025

Invited to SICOMP Special Issue

- Established an algorithm for sequential prediction achieving $O(T^{2/3-\epsilon})$ calibration error, improving on the state of the art $O(T^{2/3})$ of Foster and Vohra, 1998
- Improved lower bound $\Omega(T^{0.54})$ on calibration error achievable in sequential prediction
- Established first $\omega(T^{1/2})$ calibration lower bound for an oblivious adversary
- New upper bound and tighter lower bound reductions from calibration to the sign preservation game of Qiao and Valiant
- Devised new recursive approach to establish upper bounds in the sign preservation game
- <https://arxiv.org/pdf/2406.13668>

**Efficient Learning and Computation of Linear Correlated Equilibrium
in General Convex Games**

STOC 2025

- Established a general approach for minimizing linear swap regret with arbitrary action sets
- Established analogous ellipsoid based approaches for the computation of linear correlated equilibrium in games with arbitrary action sets
- Introduced the technique of regret minimization via semi-separation oracle (as opposed to the classic separation oracle) to handle intractable deviation sets
- Semi separation has already found broader applications (e.g. establishing the first poly-time algorithms for profile swap regret minimization)
- <https://arxiv.org/pdf/2412.20291>

**From External to Swap Regret 2.0:
An Efficient Reduction for Large Action Spaces**

STOC 2024

Invited to SICOMP Special Issue

- Devised the Tree-Swap algorithm: the first swap regret minimization algorithm with rate depending logarithmically on the number of actions N , resolving an open problem of Blum and Mansour from 2007
- Proved an equivalent swap regret rate only dependent on the Littlestone dimension of a concept class, establishing the first no-swap-regret algorithm for potentially infinite concept classes
- Established matching lower bounds, showing even oblivious, ℓ_1 -constrained adversaries can force a swap regret learner to expend exponentially many rounds
- Improved the best known dependence on N for swap regret learning in the setting of bandit feedback
- Resolved open problems about the query and communication complexity of computing ϵ -approximate correlated equilibrium in games

- Proved ϵ -approximate correlated equilibria in extensive-form games can be computed efficiently for constant ϵ , advancing a long-standing open problem for extensive-form games
- <https://arxiv.org/pdf/2310.19786>

Full Swap Regret and Discretized Calibration

ALT 2025

- Establish an efficient learning algorithm for swap regret minimization in large, structured games
- Introduce the problem of full swap regret minimization, a metric that encompasses all previously studied regret measures
- Established a family of algorithms attaining various full swap regret minimization rates for various loss settings
- Provided an algorithm for L_2 calibration matching the best-known rate, but with substantial algorithmic simplification over the state-of-the-art
- Introduced the problem of discretized calibration and established non-trivial rates using a novel regret minimization technique for nearly-strongly convex loss functions, which may be of independent interest
- <https://arxiv.org/pdf/2502.09332>

Online Learning and Solving Infinite Games with an ERM Oracle

COLT 2023

- Devised the first algorithm for online learning of arbitrary potentially-infinite hypothesis classes using only ERM oracle calls
- Provided a theoretical backing to the prevalent “double-oracle” algorithms that are the standard for solving large games in practice, unlike previous online learning algorithms that relied on the SOA oracle and had no practical utility
- Obtained similar results for non-parametric games, providing learning algorithms that only rely on best response oracles and converge to approximate-minimax equilibria in two-player zero-sum games and approximate coarse correlated equilibria in multi-player general-sum games
- <https://arxiv.org/pdf/2307.01689>

Near-Optimal No-Regret Learning for Correlated Equilibria in Multi-Player General-Sum Games

STOC 2022

- Constructed algorithmic extensions of Optimistic Hedge attaining $\text{poly}(\log T)$ internal-regret and swap-regret in multi-player general-sum games respectively
- Established a means of simulating the Stoltz-Lugosi Optimistic-Hedge algorithm as an instance of Optimistic Hedge on a combinatorial space, demonstrating that the no-external-regret of Optimistic Hedge implies no-internal-regret for Stoltz-Lugosi
- Introduced novel techniques for the analysis of Taylor expansions of multinomial functions arising from no-regret algorithms, enabling a proof that Blum-Mansour Optimistic Hedge achieves no-swap-regret
- A corollary of our bound is that both Stoltz-Lugosi and Blum-Mansour Optimistic Hedge converge to correlated equilibrium in general games at a rate of $\tilde{O}(1/T)$.
- <https://arxiv.org/pdf/2111.06008>

Near-Optimal No-Regret Learning in General Games

NeurIPS 2021

Oral Presentation

- Established that Optimistic Hedge – a common variant of multiplicative-weights-updates with recency bias – attains $\text{poly}(\log T)$ regret in multi-player general-sum games
- Exponentially improved on the best known regret attainable by no-regret learners in general games
- Introduced many novel techniques for the analysis of the performance of regret minimization algorithms, including Fourier analysis

- A corollary of our bound is that Optimistic Hedge converges to coarse correlated equilibrium in general games at a rate of $\tilde{O}(1/T)$.
- <https://arxiv.org/pdf/2108.06924>

Multi-item Non-truthful Auctions Achieve Good Revenue **SICOMP 2022**
(a.k.a. Simple, Credible, and Approximately Optimal Multi-item Auctions) **EC 2020**

- Established that first-price-type auctions can achieve a constant factor of the optimal revenue in the multi-item auction setting, resolving an open question
- Established the first credible and static multi-item auction that is approximately revenue optimal
- Obtained approximately-revenue-optimal multi-item mechanisms with fixed entry fees that are amenable to tuning via online learning techniques
- Proved a geometric lemma that enabled analysis of the utility of a first price auction, showing that welfare loss in a first price auction is at most 4 times the revenue of the posted price mechanism
- <https://arxiv.org/pdf/2002.06702>

Pattern Avoidance Over a Hypergraph **Electronic Journal of Combinatorics 2021**

- Achieved a generalization of the Stanley-Wilf theorem, bounding the number of n -permutations avoiding a fixed sub-permutation at indices corresponding to the edges of a hypergraph
- Achieved bounds for both random and deterministic avoidance hypergraphs
- In deterministic case, devised a hypergraph formulation of pattern-avoidance, enabling the use of the hypergraph containers method
- <https://arxiv.org/pdf/1906.09659>

Szemerédi-Trotter: Polynomials and Incidences **Mathematical Reflections 2016**

- For a set of reals A , proved a lower bound on the magnitude of either the set $A + A = \{x + y | x, y \in A\}$ or the set $f(A) + g(A) = \{f(x) + g(y) | x, y \in A\}$
- Initially a submission to the Intel Science Talent Search, published as an abridged version later
- One of seven math research papers awarded semifinalist in Intel STS
- <https://bookstore.ams.org/xyz-32>

WORK EXPERIENCE

Google Research **Student Researcher**
New York City 2024

- Established algorithms for full swap regret minimization over convex action sets
- Studied generalizations of swap regret minimization algorithms to high-dimensional Blackwell approachability
- Devised the first algorithm for linear swap regret minimization over arbitrary convex action sets
- Worked to close the upper and lower bound on the optimal rate of sequential calibration

Microsoft Research **EconCS Research Extern**
New England 2020

- Established that first-price multi-item auctions achieve $\Omega(1)$ of the optimal revenue
- Devised ways of compressing the information in matching problems via agent classifications while maintaining welfare guarantees for the derived matchings
- Position intended for graduate students; was employed during undergrad; only 1 opening

Optiver US LLC **Quantitative Research and Trading Intern, 2018**

- Created a machine learning model to predict volatility of the S&P500 following a day with abnormally high realized volatility

- Invented a strategy to adjust predicted volatility in response to a market input using unbiased historical data
- Traded S&P futures and options in a simulated environment using real market data
- Coded automated trading algorithms to compete against fellow interns in market making games

TEACHING EXPERIENCE

MIT Primes

Mentor, 2025

- Mentored two high school researchers in advanced theoretical and experimental projects to be submitted to the Intel Regeneron Science Talent Search
- Supervised a theoretical project investigating the existence of combinatorial graph structures known as “novelty games”
- Guided an experimental project utilizing simulations to test a conjecture in swap regret minimization
- Provided weekly personalized mentorship, teaching known mathematical tools and fostering research curiosity

Proofs and Goofs

Educational Video Creator, 2024-

- Produced a series of video lectures introducing fundamental concepts in the theory of computer science in elementary terms
- Covered topics including linear programming duality and gradient descent
- Accompanied each lecture with an original math song as a fun reward for sticking through the lecture
- https://www.youtube.com/playlist?list=PLA5LcZJOYeCXy5B_zhStbc9X_hqQTsLj2

MIT Math Learning Center

Tutor, 2019

- Helped undergraduates with coursework from classes spanning MIT’s mathematics curriculum
- Provided individual attention to students struggling on a specific topic, helping them gain intuition
- Lectured groups of students on foundational topics

Awesome Math Summer Program

Teaching Assistant, 2015-16

- 4 three-week sessions at Cornell U. (twice), UC Berkeley, and Univ. of Puget Sound, WA
- Worked alongside instructor explaining high-level olympiad math contest techniques from geometry, combinatorics, and number theory
- Worked with 50 students each camp (ages 12-16) helping them work through problems and gain problem solving intuition during classes and office hours

AWARDS AND HONORS

Akamai Presidential Graduate Fellowship	2020
Honorable Mention, USA Junior Math Olympiad	(#12 nationally) 2014
Honorable Mention, USA Junior Math Olympiad	(#15 nationally) 2013
#1 Team, PClassic Computer Programming Competition	2015
Harvard-MIT Math Tournament HMMT individual round	(#19 internationally) 2015
AMC 10 perfect score (150) 3-time AMC Distinguished Honor Roll	2012-16

#1 Individual Scorer, NY State Math Tournament (Curt Boddie Award)	2014
#1 Individual Scorer, NYC Math Tournament (NYCIML), 3 years in a row	2014-16
